\* For general web development projects Photoshop is very useful. Use it for the following: \* Making a logo : Use the cloning and healing features to duplicate layers and recolor the layers to make a new image. \* Creating textures : Use the product textures and the filter effects to create textures on layers. \* Creating a photo-manipulation effect : Use the lasso tool to select an area of an image, use the filter effects to alter the image, and then use the healing tool to repair the image after you've moved it around. \* Creating graphic illustrations : Use the Clone Stamp tool to pull the background color from another image and replace it with your own color. You can also create an outline of the shape of an object. Use the Liquify filter to distort the shape and create more artistic images. \* Creating a photo book : Use the lasso tool to create a frame for a photo and use the crop tool to trim the image to create a flat page. \* Creating a virtual-studio project : Use the Healing tool to combine multiple layers into one. Create a text box and then use the Gaussian Blur filter to blur the text into the background. \* Image manipulation : Create a photo in a composite of three images. Use the Clone Stamp tool to selectively modify one of the original images. Use the Rectangular Selection tool to select and copy individual parts of the image and then paste them back into the composite. Repeat this process until you have the image you want. You can also create a collage using smart objects with layers. \* Photo resolution : Use the Levels and Curves tools to improve images' overall quality. \* Packing artifacts : Use the red eye tool to remove artifacts in images. Because Photoshop has been the standard in photo editing for so long, many Photoshop gurus out there are earning a living from their artistic prowess. They can give you a great deal more information about the program than we can in a single chapter. Creating Textures

Creating textures gives your images visual appeal and draws your viewer's attention. Though Photoshop has a variety of ways to create textures, we'll use one of the most easy and effective ways in this chapter: the product textures. You can purchase these textures for Photoshop from the Adobe website, as we're about to do.

Gliomas are primary tumors of the nervous system that are characterized by an uncontrolled growth of malignant cells. Although patients with these tumors are usually treated with surgery, the prognosis for glioblastomas, the most malignant form of gliomas, remains poor because these tumors are often resistant to chemotherapy and radiation. A central mechanism in maintaining the malignant phenotype is the ability of glioma cells to survive in nutrient-poor conditions. Nutrient-deprivation induces a change in cell metabolism called the Warburg effect, which is characterized by an increase in the production of lactic acid and glycolysis as the primary source of ATP. As a result of this increased glycolysis, cancer cells also upregulate their transcription of key enzymes of the glycolytic pathway. Glucose transporter 1 (Glut-1) is highly expressed in high-grade gliomas and is important for the uptake of glucose in glioma cells. Thus, inhibition of Glut-1 might prevent tumor growth and stimulate apoptosis by limiting glycolysis. Indeed, small molecule inhibitors of Glut-1, such as (S)-4-acetamido-4-[4-fluorophenyl]-7-(2-thienylmethoxyimino)-2-(quinoline-8-sulfonyloxy)-1,3,5-triazepine hydrochloride, (S)-4-acetamido-4-[4-fluorophenyl]-7-(2-thienylmethoxyimino)-1,3,5-triazepine monohydrate, or 2-aminobenzoylacetic acid, have been shown to inhibit glioma growth *in vitro* and *in vivo*. However, the mechanisms of the anticancer activity of Glut-1 inhibitors are poorly understood. A recent study found that Glut-1 inhibition enhances the antitumor activity of radiation in glioma cells. Additionally, treatment with cotreatment of Glut-1 inhibitors and the ionizing radiation induces a significant increase in the percentage of cells in the G2 phase of the cell cycle and a decrease in the percentage of cells in the G1 phase of the cell cycle. We found that the radiosensitization effect of Glut-1 inhibitors is associated with an increase in the expression of tumor suppressor p21 (Cip/Kip family members) through the activation of the p

Mass spectrometry (MS) has been applied to the study of the effects of protein kinase C (PKC) activation on glucose transport in PC12 cells. It was found that 10 min incubation of cells with 100 nM phorbol-12-myristate-13-acetate (PMA) activates PKC, elevating the activity of this kinase to levels in the order of 100-fold that of control cells. Glucose transport was significantly elevated in cells treated with PMA, reaching a maximal (approximately 3-fold) stimulation between 10 and 20 min after the addition of PMA. This effect was not blocked by the PKC inhibitor calphostin C. Preincubation of the cells with 200 nM calphostin C to inhibit PKC activity did not affect the ability of PMA to elevate glucose transport. Neither the kinetics of the PMA-induced effect on glucose transport nor the effect of PKC inhibition on PMA-stimulated glucose transport was altered by preincubating cells with 200 nM calphostin C. A possible explanation of these results is that all PKC isozymes are activated by PMA to a similar extent in PC12 cells. Western blotting showed that PMA treatment causes translocation of PKC beta isozyme to the plasma membrane and also increased expression of PKM1 and PKM2. Phosphorylation of the glucose transport system is controlled by several kinases. Nevertheless, the ability of PMA to elevate glucose transport in PC12 cells was not blocked by preincubation with H-8, an inhibitor of protein kinase A or with H-89, an inhibitor of protein kinase G.
