Adventitious root growth-promoting plants that colonize bare soil or seed-contaminated mulch may facilitate the spread of switchgrass (*Panicum virgatum* L.) and other forage grasses for use as energy crops. The presence of adventitious roots on the trunk of epiphytes such as mosses, lichens, and ferns (often referred to as epiphytes) is a common trait. The use of epiphytes as root colonizers in nutrient remediation may be important to the spread of switchgrass. In this study, epiphytes were treated with nitrogen (N), phosphorus (P), potassium (K), and calcium (Ca) to test for significant changes in macro- and micronutrients. The concentrations of the major nutrients were determined via field experiments, as well as within the epiphytes themselves. The concentrations of N, P, and K were increased significantly in mosses, lichens, and ferns. Epiphytes may play an important role as colonizers to facilitate the expansion of switchgrass and other forage grasses.

Q: Need solr.xml file for the solrwebapp I'm very new to Solr, so please forgive any stupid questions in advance. "The Center is specifically highlighting areas where such a strategy can be most effective in bringing new jobs and prosperity to the state." The report, which focuses on what it calls New Jersey's "big six" industries — healthcare, education, finance/insurance, government, retail and energy/utilities — shows that the Garden State is doing relatively well when it comes to these six
